Read through the safety information and operating instructions carefully before using your Waterous Foam Manager.

#### Visit us at www.waterousco.com

Waterous Company 125 Hardman Avenue South, South St. Paul, Minnesota 55075 USA (651) 450–5000 Instructions subject to change without notice.

Read through the safety information and operating instructions before using your Waterous Foam Manager.

## 

Death or serious personal injury might occur if proper operating procedures are not followed. The pump operator, as well as individuals connecting supply or discharge hoses to the apparatus must be familiar with these pump operating instructions as well as other operating instructions and manuals for the apparatus, water hydraulics and component limitation.

## 

#### Pressure Hazard. May result in personal injury.

Prior to connection or removal of hoses, caps or other closures with pump intake or pump discharge connections, relieve pressure by opening drains or bleeder valves. Bleeder valves should also be used while filling a hose connected to an intake with water.

## 🗥 WARNING

#### Scalding Water Hazard. May result in serious burns.

When operating the pump, be sure to open at least one discharge valve slightly to prevent the pump from overheating. If the pump runs for a few minutes completely closed, it may heat the water enough to scald someone when the valve is opened. Overheating can damage the packing, seals and other pump parts. If the apparatus builder has installed a by-pass system or other provision designed to prevent overheating, opening a discharge valve may be unnecessary.

## 🗥 WARNING

#### Hose Pressure Hazard. May cause serious personal injury.

Use only fire hose that is rated at 200 PSI or higher working pressure.

## Introduction

## **System Overview**

#### NOTE: Read and understand the operating instructions for the Foam Manager System prior to operating. (Refer to Figure 1 for system components.)

The Foam Manager<sup>™</sup> System consists of an Advantus<sup>™</sup> Foam Management System mounted on a Waterous CM or CS fire pump.

#### Advantus ™ 3/6 Foam Management System

The ADVANTUS<sup>™</sup> foam system uses advanced conductivity-based technology to monitor both supply water and foam solution in order to deliver optimal foam at every call. Regardless of the foam concentrate or the quality of the water being pumped, the ADVANTUS automatically adjusts for both, providing you with the most accurate fire suppression capabilities in the industry.

#### Foam Pump

The 12 or 24–volt electric motor driven, Hydra–Cell positive displacement foam concentrate pump is constructed of brass and stainless steel components which may come in contact with foam concentrate, making the pump resistant to chemical and corrosive attack. The pump is capable of handling suspended abrasives without sustaining any damage and can run dry for extended periods without sustaining damage.

The foam pump for the Advantus 3 is rated at 3 GPM (11.3 l/min) at 150 psi (10 bar) and 6 GPM (22.6 l/min at 150 psi (10 bar) for the Advantus 6, with operating pressures up to 450 psi (32 bar). The system draws a maximum electrical load of 40 amps @ 12 VDC or 21 amps @ 24 VDC (Advantus 3) or 80 amps @ 12 VDC or 40 amps @ 24 VDC (Advantus 6).

A pump motor electronic driver, located inside the controller housing receives signals from the microcontroller and powers the electric motor in a variable speed duty cycle to ensure that the correct amount of foam concentrate as set by the pump operator is injected into the water stream.

#### **Process Manifold**

The foam system process manifold, constructed of stainless steel with Victaulic<sup>®</sup> groove connections provided at each end of the manifold for connection to the apparatus plumbing. The process manifold includes an incoming water conductivity probe, paddlewheel flowmeter, foam injection check valve, Akron Brass<sup>®</sup> waterway check valve and foam solution conductivity probe. An Akron full-flow brass body check valve in the foam process manifold waterway prevents foam contamination of fire pump and water supply. A brass and stainless steel check valve provided in the foam concentrate line at the foam injection point to prevents water backflow into the foam supply reservoir(s). Stainless steel conductivity probes include gap spacers and a reverse charge feature to prevent build-up of deposits on the probe surfaces.

The system also incorporate a sensor to measure water temperature to ensure the proper amount of concentrate is injected.

## System Components

## Operation

A pumper equipped with a Foam Manager<sup>™</sup> foam unit can be operated in water only and/or foam modes. It is possible to pump water from one discharge and foam solution from another discharge.

## Water Only Operations

All unit operations begin with pumping water. See the following instruction for details on how to operate and pump water from your Waterous fire pump:

- F-1031, Section 2114, Operation and Maintenance Instructions for Waterous CMU Series Centrifugal Fire Pumps or
- F-1031, Section 2115, Operation and Maintenance Instructions for Waterous CS and CSU Series Centrifugal Fire Pumps

#### CAUTION

#### Overheating hazard. May cause damage to the pump.

Running the unit without adequate water flow or an overheated water supply can cause damage to the pump.

## Advantus<sup>™</sup> Foam Pump Operation

Upon power up, the software revision number will be displayed. The unit will then display the flow rate.

Because the conductivity measurement for a given percentage mix changes with the flow rate, the calibration data is stored in an array. The array holds entries for the various parameters at several different flow rates that are in between flow rates entered in the data array.

#### Figure 2. Operator Interface Terminal

IL2963

During normal operation, the OIT (Operation Interface Terminal) will display flow rate, percent mix, total water or total product.

SELECT	Selects data to display. The default is to display flow rate. Pressing the SELECT button will scroll through the list, then wrap back around to the top of the list. The associated LED will light to indicate what data is being displayed.			
	Flow Rate			
	Mix Percentage			
	Total Water			
	Total Product			
	Holding the SELECT button for more than two seconds will lock the display to the current position. Pressing the SELECT button again will unlock.			
UP ARROW	When the Mix Percentage is displayed, the current mix setpoint will be displayed. Sub- sequent presses of the UP ARROW button will increase the Mix Setpoint by 0.1%. After a ten second timeout, the display will return to the Flow Rate display.			
DOWN ARROW	When the Mix Percentage is displayed, the current mix setpoint will be displayed. Sub- sequent presses of the DOWN ARROW button will decrease the Mix Setpoint by 0.1%. After a ten second timeout, the display will return to the Flow Rate display.			
	Pressing both UP and DOWN simultaneously when the Total Water is displayed resets the Total Water accumulator to Zero.			
	Pressing both UP and DOWN simultaneously when the Total Product is displayed resets the Total Product accumulator to Zero.			
	Pressing both UP and DOWN simultaneously when the Flow Rate is displayed enters the MANUAL mode of operation. See Manual Mode operation below.			
	Pressing both UP and DOWN simultaneously while in Mix % will go to the default %.			
FOAM	Pressing the FOAM key will alternately start and stop the foam operation. When the control- ler is running, the FOAM LED will be lit. The FOAM LED will blink when the motor control output is active. The LED will be lit and not blink during the initial pump delay, or when the system is on, but no water flow is detected.			
	If flow is detected, and one or both of the sensor inputs reads full scale, an open sensor error will be flagged. The error SEn1 or error SEn2 will be displayed when the FOAM button is pressed to indicated that the system is non-functional. In this case, the Manual Mode will be functional and must be used.			
MANUAL MODE	If the display is showing the flow rate and the two ARROW keys are pressed simultaneously, the % MIX LED will be lit and the display will show a default value of 2.0. Use the UP and DOWN arrow keys to increase or decrease this value in steps of 0.5.			
	NOTE: Pump output is based on a theoretical ratio of foam to water at 50 GPM.			
	Pressing both ARROW keys again exits the MANUAL mode and stops the pump.			
	NOTE: Motor/Pump Assembly will operate in manual mode whether or not there is a water flow. If the INJECT/BYPASS valve is in the INJECT position, foam concentrate will be injected into the system, which will waste concentrate.			
AUTO RUN	The system is equipped with an AUTO RUN feature. If the voltage (+12 or 24 VDC) is applied to position 1 on the terminal strip, it will have the same effect as pressing the Red FOAM button. This will start the Foam system. The system will not inject foam until water is flowing.			

## **Foam Operation**

After the pump is operating, turn on the foam pump to inject foam concentrate into the water stream.

Refer to Advantus Foam Pump Operation Instructions on Page 5.

## Foam System Flush

1. Turn off Foam Pump.

2. Flow clear water through discharges that were used until clear water is flowing from the nozzle.

## Service and Maintenance -

## **Maintenance Schedule**

#### Table 2. Maintenance Schedule – Foam Pump (See Figure 3)

Check Oil Level and for Oil Leaks	Foam Pump Oil				Check and		
	Change	Foam Pump Model	Level from Top of Oil Fill Port	Capacity Required for Oil Change	Use Oil	Clean Foam Concentrate In–line Strainer	Flushing System
Daily or After Each Use	Annually	Advantus 3	3/4 inch (19 mm)	.90 quarts (Total capacity is 1.0 quart)	Synthetic 10W–30	Monthly )	Depending on the corrosiveness of the foam concentrate to be used, flushing of the foam injection circuit may be necessary. Most Class A foam concen- trates are less corrosive and may not require flushing.
		Advantus 6	1 inch (25 mm)	1.0 quarts (Total capacity is 1.1 quarts)	(Mobil 1 recommended)		

## Location of Maintenance Items

The following figures show the location of the Advantus Foam Pump oil fill and drain.

Figure 3. Advantus<sup>™</sup> Foam Pump Oil Fill and Drain, In–line Foam Concentrate Strainer

## Advantus<sup>™</sup> Foam Pump

The Advantus<sup>™</sup> system is able to be field calibrated using the control function buttons on the operating interface terminal (OIT), see Figure 8.

### A. Entering Calibration Mode

- 1. Entering calibration is accomplished by using the control unit functions buttons.
- 2. To enter this function, press and hold the **SELECT** button for minimum of five seconds.
- 3. Continue to hold the **SELECT** button.
- While the SELECT button is depressed, push the UP and DOWN arrow buttons at the same time. The display will show CAL for two seconds and then display F1.
- 5. Use the **UP** button to advance to the next parameter (F2, F3, F4).
- 6. Use the **DOWN** button to back up to a previous parameter (F2, F1).
- 7. To edit a parameter, press the **SELECT** button at the associated Fn prompt.

#### B. F1 – Default Mix Percentage

- 1. At the F1 prompt, press the SELECT button.
- Use the UP and DOWN arrow buttons to select the default FOAM %. The only foam % selections will be .1%, .2%, .3%, .4%, .5%, .6%, .7%, .8%, .9%, 1.0%, 3.0% and 6.0%.
- 3. When finished, press the **SELECT** button to save the displayed value.

#### C. F2 – Units of Measurement

The units of measurement must be selected prior to any calibration functions. Units of measurement are U.S. Gallons, Imperial Gallons and Liters.

- 1. Push the **SELECT** button at the **F2** prompt. The display will show the current setting.
- 2. Use the **UP** and **DOWN** arrow buttons to select one of the following measurement units:
  - GAL will select U.S. Gallons
  - IPL will select Imperial Gallons
  - LTR will select Metric Liters
- 3. Pushing the **SELECT** button will save the displayed selection. This will allow for calibration of the water flow in the units of measurement selected.

Only units of measure, water flow and the foam percentage default can be field set.

## D. F3 – Flow Rate Calibration

- 1. Press the **SELECT** button at the **F3** prompt. The current measured flow rate will be displayed. Establish a flow using an accurate flow measuring device.
- Once this is established, press the UP or DOWN button to advance to the calibration step. If the displayed flow rate is correct, press the SELECT button to return back to the F3 prompt. If there is insufficient flow, the display will show LoFL for two seconds, then return back to the F3 prompt.
- 3. The display will now display **50** (starting value) or the last calibration value entered.
- 4. Use the **UP** and **DOWN** arrow buttons to change the displayed value to match the actual flow rate according to the flow measuring device. If the button is only pressed momentarily, the display increments or decrements by one. If the button is held, the display will increment or decrement by five.
- 5. Once the correct flow is achieved, pushing the **SELECT** will save the setting and return to the **F3** prompt.

## E. F4 – System Lock

System can be locked out after calibration and setup to avoid accidental changing.

#### F. Saving Calibration

To save all the calibration settings to flash memory, press the **FOAM** button while at the **Fn** prompt. The data will be stored and the unit will return to normal operation.

# **Troubleshooting Guide**

It is important to know what to do if your foam system in not operating properly. This troubleshooting guide should help you diagnose, isolate and fix the problem encountered.

Problem	Cause	Fix
	Using wetting agent in place of foam	Flush system and install Class "A" foam.
Poor foam solution (wet or dry)	Lack of foam	Check if the Foam Pump is on. Check if there is foam in the reservoir. Make sure the foam supply valve is on and the Y strainer clean.
	Foam dumped into the water tank	Flush water tank and pump until foam is cleared.
	Foam cell is leaking into water tank	Condition applies to tanks utilizing a common wall(s) between the foam tank and the water tank. If a leak is confirmed, repair the foam tank and flush the water tank and pump until foam is cleared.
Foam in water system	Foam proportioning manifold check valve mal- function	If the above conditions have been corrected, the final cause for foam in the water tank may be the result of a malfunctioning foam manifold check valve. To troubleshoot, cap off one foam dis- charge that is plumbed to the foam manifold, open that discharge valve and increase the pump discharge to 30–40 PSI. Disengage the pump and monitor the corresponding discharge PSI gauge, looking for a drop in discharge pres- sure. If the PSI drops, it indicates the foam man- ifold check valve is leaking and requires repair.
	Foam manifold drain plumbed into master drain	Supply a separate drain for foam manifold.
